

Continuity and Discontinuity

Julia: What does it mean for a graph to be discontinuous? I don't get it!

Dylan: I think it's like when there's a hole in the graph or something.

James: Actually there are different kinds of discontinuities, but it's hard to visualize so let's take a look!

Altogether: LET'S DIVE IN!

Introduction

Question 1 A function f is said to be continuous at a point $x = a$ if which three conditions are satisfied?

Select All Correct Answers:

- (a) $f(a)$ is defined ✓
- (b) $f(a) \neq 0$
- (c) $\lim_{x \rightarrow a} f(x)$ exists ✓
- (d) $\lim_{x \rightarrow a} f(x) = f(a)$ ✓
- (e) $f(x)$ is linear
- (f) $f(x) \neq f(a)$

Example

Take the function $f(x) = \frac{(1-x)^2}{1-x}$.

Learning outcomes:

Through some simple elimination, we can easily see that this function is equivalent to $1 - x$, where $x \neq 1$. Thus, there is one point on the original function we should pay close attention to: $x = 1$.

Using the simple trick of squaring the denominator to create our numerator, we were able to easily pick a point where we will have a discontinuous function, without using a jump or infinite discontinuity. Jump discontinuities can easily be made using piecewise functions, and infinite discontinuities are often best made with rational functions, like fractions of polynomials! Don't worry if you haven't discussed these discontinuities yet; we'll see plenty in this lab!

Problems

Question 2 Consider the graph of $y = f(x)$ below

Which of the following are true?

Multiple Choice:

- (a) f is continuous at $x = 0.5$
- (b) f is continuous at $x = 1$
- (c) f is continuous at $x = 1.5$ ✓

Question 3 Create a function with the left handed and right handed limits not equal. What kind of discontinuity have you made here? Is there any kind of discontinuity that can't be created like this? Is there another that can? Consider the function

$$f(x) = \frac{x^3 + 6x^2 + 12x + 8}{x + 2},$$

Describe the continuity of this function. If there is a discontinuity, where is it present? Is it possible to modify the function to remove this discontinuity? If so, how?

Free Response:

Question 4 Consider the function

$$g(x) = \frac{5x + 2}{2x - 3},$$

Describe the continuity of this function. If there is a discontinuity, where is it present? Is it possible to modify the function to remove this discontinuity? If so, how?

Free Response:

Question 5 Design a function with a removable discontinuity at 2, and a jump discontinuity at 0.

Free Response:

Question 6 Design a function with an infinite discontinuity and at least one other type of discontinuity

Free Response:

Julia: Whenever I see people talking about jump discontinuities, they always use piecewise functions. Do you think it's possible to make one without the function being piecewise?

Dylan: If there's one thing that I've learned in math, it's that there are usually two ways to do anything! I'm not really sure how you would make something like that though...

James: I know one function that would work! Here's a hint - my function has one value on the positives, the opposite of that on the negatives, and is undefined at 0.

Question 7 Can you create a function which has a jump discontinuity, but is not piecewise?

Free Response:

Julia: Hey y'all, I was looking at our continuous graphs and noticed something.

Dylan: What did you see? They all look like pretty normal functions to me.

James: Yeah, I don't really know what you mean.

Julia: Well, discontinuities mean there are a chunk of the graph where you can skip over a value, right? Like, we can jump right from 1 to 5, or have a hole where some value isn't attained.

Dylan and James: Right. And?

Julia: I think if we picked a continuous function and looked at the functional values on each end of a range, we could say something about all the values in between those two!

Question 8 *Can you create a function which has a jump discontinuity, but is not piecewise?*

Free Response:

Question 9 *Hint:* Can we skip any of the values?

What can we say about every value in a range $[f(a), f(b)]$ on a continuous graph?

Free Response:
