

Curve Sketching

Introduction

Dylan: Using CAS systems to graph is great and all, but on a test where I don't have a calculator it's so hard to sketch a curve!

James: Well maybe we can use derivatives to figure out properties of the graph so it's easier to sketch!

Dylan: Oh! We'd be able to see where the graph was heading up or down, plus we'd be able to see maxima when the derivative at a point is zero!

Guided Problems

Using your favorite computer algebra system, answer the following questions. Include an image of your graphs along with your answers, so the instructor may see your progress in your lab submission.

Question 1 Consider the function $f(x) = x^3 + 12x^2 + 4$.

Graph of $x^3 + 12x^2 + 4$

Indicate the intervals where the function has positive and negative slopes, and indicate the locations at which the slope changes sign. At these points, please indicate if the slope is changing from positive to negative or negative to positive. What will the derivative be at these points?

0

Using your CAS, determine the derivative of the given function. Then, evaluate the derivative at the points you indicated, as well as a point on each interval you indicated.

Create a number line, and mark the points where the derivative was zero. Between these points, mark the sign of the derivative of any point on that interval (You may do this by hand as it is difficult to format using most CAS systems). An example is shown below.

Learning outcomes:

Select everything you can predict about the graph of a function at a point where the derivative is 0:

Select All Correct Answers:

- (a) The graph will be flat at that point. ✓
- (b) The slope will change from positive to negative at the point.
- (c) The slope will change from negative to positive at the point.
- (d) The slope will change sign going from one side of the point to the other.

Feedback (attempt): If the derivative at a point is zero, we can only tell that the graph flattens out. It is possible that the sign does not change after crossing the point!

Julia: So we have local maxima and minima when the derivative is 0, but what about the graph of x^3 ?

Dylan: Hmmm...I guess that means there are three different kinds of critical points! Two when the sign changes and one when it stays the same!

Julia: Wait... what's a critical point?

Dylan: Any point where the derivative is zero or does not exist! Because we know it's important, but we have to check to see what it means with our number line!

James: You guys are still figuring that out? I'm already determining concavity!

Dylan and Julia: Holy cat fur! What's concavity?!

James: A graph is *concave up* when its derivative is increasing, and *concave down* when its derivative is decreasing. The easiest way to tell is to look at the curve and think 'Would this hold water?' If it would, it's concave up, and if not, it's concave down!

Dylan and Julia: Wow! Thanks James!

Question 2 *Examine the graph of the original function.*

$$\text{Graph of } x^3 + 12x^2 + 4$$

Where is the graph concave up?

Multiple Choice:

- (a) $[0, 1]$
- (b) $[-4, \infty)$ ✓
- (c) $(-\infty, 0]$
- (d) $[0, 260]$
- (e) $[4, 260]$

Feedback (attempt): *Concavity does not change at the relative maximums or minimums - it changes at some point along the change from up to down, or down to up.*

What about concave down?

Multiple Choice:

- (a) $[0, 1]$
- (b) $[-4, \infty)$
- (c) $(-\infty, -4]$ ✓
- (d) $[0, 260]$

(e) $[4, 260]$

Graph the derivative on the same axes as the function. Notice where it is increasing and decreasing.

Now use your CAS to determine the derivative of the function's derivative, $f''(x)$. Then evaluate at interesting points on the graph of the derivative. Points where the second derivative is zero are known as inflection points. What happens at these points?

Multiple Choice:

- (a) They show the function is at extrema as well.
- (b) They indicate that concavity will remain the same.
- (c) They indicate that concavity is changing. ✓
- (d) They show that the function is at minimum change.

Draw another number line, this time for the second derivative, marking the inflection points. Evaluate $f''(x)$ on a point of each of the intervals created through this marking, and mark the sign. What might this mean in general for changing signs on each side of an inflection point?

Select All Correct Answers:

- (a) The graph will be flat at that point.
- (b) The concavity will change from up to down at the point.
- (c) The concavity will change from down to up at the point.
- (d) The slope will change direction going from one side of the point to the other. ✓

Inflection points are given as ordered pairs. Evaluate each inflection point you found using $f(x)$ to determine the ordered pairs, then select them below.

Select All Correct Answers:

- (a) $(-4, 132)$ ✓
- (b) $(0, 4)$
- (c) $(-12.028, 0)$
- (d) $(-8, 260)$

Matching Graphs

Dylan: So if I wanted to match a graph with the graphs of its first and second derivative I can do that now!

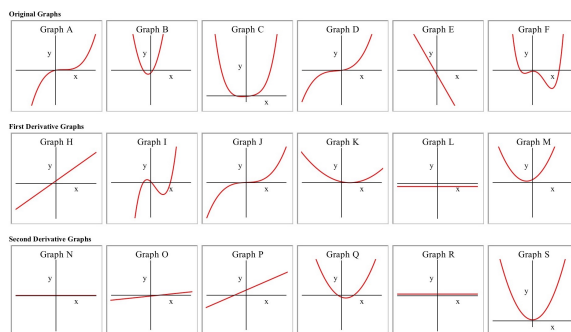

Julia: Wait, really?? How?

James: Well the y value of $f'(x)$ corresponds to the slope of $f(x)$, and the y value of $f''(x)$ corresponds to the slope of $f'(x)$ and is related to the concavity of $f(x)$.

Julia: So we can match the graphs based on how all that information relates!

Dylan: Exactly, let's try it!

Match each graph to its first and second derivative, create a table to organize by $f(x)$, $f'(x)$, and $f''(x)$.

On Your Own - Need Answers

Now, for the function

$$x^5 - 5x^4 + 5x^3 + 5x^2 - 6x - 1$$

. Find:

- Extrema
- Critical Points
- Inflection Points
- Concavity

In Summary

In this lab, you've covered quite a bit. To help organize everything, we've made the following table for you.

First Derivative Test	<p>When $f'(x) = 0$:</p> <ul style="list-style-type: none"> (a) A maximum occurs if at this point, the sign of the derivative changes from positive to negative. (b) A minimum occurs at this point if the sign of the derivative changes from negative to positive. (c) An inflection point occurs at this point if the sign of the derivative stays the same. <p>When $f'(x)$ does not exist:</p> <ul style="list-style-type: none"> (a) If x is in the domain of $f(x)$, follow the same steps as when $f'(x) = 0$. (b) If x is not in the domain, then x is not a critical point.
Second Derivative Test	<p>If $f'(x) = 0$,</p> <ul style="list-style-type: none"> (a) A local maximum occurs if $f''(x) > 0$. (b) A local minimum occurs if $f''(x) < 0$. (c) The test fails if $f''(x) = 0$.
