

**Julia:** What does it mean for a graph to be discontinuous? I don't get it!

**Dylan:** I think it's like when there's a hole in the graph or something.

**James:** Actually there are different kinds of discontinuities, but it's hard to visualize so let's take a look!

**Altogether:** LET'S DIVE IN!

## Introduction

**Question 1** A function  $f$  is said to be continuous at a point  $x = a$  if which three conditions are satisfied?

**Select All Correct Answers:**

- (a)  $f(a)$  is defined ✓
  - (b)  $f(a) \neq 0$
  - (c)  $\lim_{x \rightarrow a} f(x)$  exists ✓
  - (d)  $\lim_{x \rightarrow a} f(x) = f(a)$  ✓
  - (e)  $f(x)$  is linear
  - (f)  $f(x) \neq f(a)$
- 

## Example

Take the function  $f(x) = \frac{(1-x)^2}{1-x}$ .

## *Continuity and Discontinuity*

Through some simple elimination, we can easily see that this function is equivalent to  $1 - x$ , where  $x \neq 1$ . Thus, there is one point on the original function we should pay close attention to:  $x = 1$
