Introduction to Sage and Ximera

SageMath is a computer algebra system which uses python, throughout these labs sage cells will be used for certain problems. This lab introduces you to the basics of using SageMath via Sage Cells.

Introduction

If you ever want to use a sage cell when one is not provided, or would like to experiment with Sage Cells, you can follow this link.

_ SAGE _

Functions

To define a function you use the notation in the following sage cell:

 $f(x)=x^5+3*x+4$

Question 1 What output did you get from evaluating the sage cell?

Multiple Choice:

- (a) None ✓
- (b) $f(x) = x^5 + 3x + 4$
- (c) $x^5 + 3x + 4$

Feedback (attempt): All we did was define a function, to see the function definition type f(x).

Evaluate the function at x = 3 by typing f(3) in the sage cell, what did you get? 256

Question 2 Define $f(x) = \sin(x)^2$ in the following cell evaluate at $x = 4\pi$

Learning outcomes:

See link at https://sagecell.sagemath.org/
