### Transformations of Functions

Julia: Ugh!

Dylan: What's up Julia?

**Julia:** I have these functions I have to graph, and they're *so* close to functions I know really well, but they're a little bit different and it makes it so I have to calculate a bunch of points before I can confidently graph it!

James: Sounds like you could use some help Julia!

Julia and Dylan: James!

**James:** There are a ton of ways to transform functions, so let's get going and look at how we can modify our favorite functions!

### Introduction

While you work with many different functions, there are only a few basic types of functions. These include polynomials, rational functions, trigonometric functions, exponential functions, and logarithmic functions. In this lab we will explore different variations on these basic functions called **transformations**.

# Guided Example

Consider the function  $f(x) = x^2$ .

Graph of  $x^2$ 

**Question 1** On the same axis graph g(x) = f(x) + 2, what change happened from f(x) to g(x)?

The graph shifted  $\boxed{2}$  units  $\boxed{up}$ .

What can you infer about f(x) - 2?

The graph would shift  $\boxed{down}$   $\boxed{2}$  units.

Learning outcomes:

Consider the function f(x+2), or  $(x+2)^2$ . How do you think this graph will be different from the graph of f(x)?

#### Free Response:

Graph the function f(x+2), was your prediction correct? What can you infer about the function f(x-2)? Graph this function to verify your prediction.

#### Free Response:

What rule can you write about a general function f(x+c) where c is a positive constant? The function will shift c units e

Why do you think the graph moves in the direction it does when using the rule you determined in the last question? Hint: Think about the x-intercept and how it changes when you add or subtract a constant from the x value

#### Free Response:

How do you think the graph of f(x) be affected when you multiply the whole function by some constant c? Graph the function for the following values of  $c = 2, \frac{1}{2}, -2, \frac{-1}{2}$ 

Graph of

#### Free Response:

Describe what is happening to the function based on the value of c, what can you generalize from this? It may be helpful to make a table with the x and y values to understand why this change happens.

#### Free Response:

## On your own

**Question 2** Using  $g(x) = x^2$  as your base function create a new function that will shift the graph up 4 units, to the right 3 units, reflect it across the x-axis and stretch it vertically by a factor of 2 and graph it below

Graph of

Graph the function g(2x)

Graph of

#### Transformations of Functions

What constant does this stretch or compress  $x^2$  by? 1/c Graph g(2x+6) on the same axis above, what transformation occurred?

#### Free Response:

Note the following expansion of the general function  $f(x) = (ax + b)^2$ :

$$f(x) = (ax + b)^2 = \left(a\left(x + \frac{b}{a}\right)\right)^2 = a^2\left(x + \frac{b}{a}\right)^2$$

From this expansion, how is a function in the form  $f(x) = (ax+b)^2$  being shifted and stretched/compressed in terms of a and b?

## In Summary

Fill in how the graph of  $f(x) = x^n$  changes for each of the following cases.

Question 3  $cf(x) = cx^n$ 

- (a) When c > 1
- (b) When c < 1
- (c) When 0 < c < 1

$$f(x) = (x+c)^n$$

- (a) When c > 1
- (b) When c < 1

$$f(x) = x^n + c$$

- (a) When c > 1
- (b) When c < 1

$$f(x) = a(x-b)^n + y \square$$
